

Mounds Lake Project

Will the dam hold water?

Yes. The Phase II engineering study examined this issue. Additional data will be collected in Phase III and if areas of concern are discovered that require some type of engineered control, they will be properly addressed.

Aren't dams a thing of the past?

There are over 80,000 dam structures across this country. A quick goggle search finds reservoirs under design or construction in Georgia, Florida, Texas and California. There are several dams being removed dating from 30 years old to one from the 18th century. Most of the dams being removed are more than 100 years old and no longer needed.

Dams across the world provide billions of people drinking water, flood control and electricity. Dams will continue to be an important infrastructure component of growing regions for the foreseeable future.
